ORIGINAL INSTRUCTIONS IC101H

# Installation, Operation & Maintenance Manual

Sliding-Vane Stationary Pumps for LPG and NH<sub>3</sub> All Models 51, 521, and 1021

Warning: (1) Periodic inspection and maintenance of Corken products is essential. (2) Inspection, maintenance and installation of Corken products must be made only by experienced, trained and qualified personnel. (3) Maintenance, use and installation of Corken products must comply with Corken instructions, applicable laws and safety standards (such as NFPA Pamphlet 58 for LP-Gas and ANSI K61.1-1972 for Anhydrous Ammonia). (4) Transfer of toxic, dangerous, flammable or explosive substances using Corken products is at user's risk and equipment should be operated only by qualified personnel according to applicable laws and safety standards.

Solutions beyond products...

### **Warning**

Install, use and maintain this equipment according to Corken's instructions and all applicable federal, state, local laws and codes. Periodic inspection and maintenance is essential.

### **Corken One Year Warranty**

CORKEN, INC. warrants that its products will be free from defects in material and workmanship for a period of one year from date of installation, provided that the warranty shall not extend beyond twenty-four (24) months from the date of shipment from CORKEN. If a warranty dispute occurs, the DISTRIBUTOR may be required to provide CORKEN with proof of date of sale. The minimum requirement would be a copy of the DISTRIBUTOR'S invoice to the customer.

CORKEN products which fail within the warrant period due to defects in material or workmanship will be repaired or replaced at CORKEN's option, when returned, freight prepaid to CORKEN, INC., 3805 N.W. 36th St., Oklahoma City, Oklahoma 73112.

Parts subject to wear or abuse, such as mechanical seals, blades, piston rings, valves and packing, and other parts showing signs of abuse, neglect or failure to be properly maintained are not covered by this limited warranty. Also, equipment, parts and accessories not manufactured by CORKEN but furnished with CORKEN products are not covered by this limited warranty and the purchaser must look to the original manufacturer's warranty, if any. This limited warranty is void if the CORKEN product has been altered or repaired without the consent of CORKEN.

All implied warranties, including any implied warranty of merchantability or fitness for a particular purpose, are expressly negated to the extent permitted by law and shall in no event extend beyond the expressed warrantee period.

CORKEN DISCLAIMS ANY LIABILITY FOR CONSEQUENTIAL DAMAGES DUE TO BREACH OF ANY WRITTEN OR IMPLIED WARRANTY ON CORKEN PRODUCTS. Transfer of toxic, dangerous, flammable or explosive substances using CORKEN products is at the user's risk. Experienced, trained personnel in compliance with governmental and industrial safety standards should handle such substances.

### Important notes relating to the European Union (EU) Machinery Directive

Pumps delivered without electric motors are not considered as machines in the EU Machinery Directive. These pumps will be delivered with a Declaration of Incorporation. The fabricator of the machinery must assure and declare full compliance with this Directive before the machine in which the pump will be incorporated, or of which it is a part, is put into service.

#### **Contacting the Factory**

Before you contact the factory, note the model number and serial number of your pump. The serial number directs us to a file containing all information on material specifications and test data applying to your specific pump. When ordering parts, the Corken service manual or Operations, Installation and Maintenance (IOM) manual should be consulted for the proper part numbers. ALWAYS INCLUDE THE MODEL NUMBER AND SERIAL NUMBER WHEN ORDERING PARTS.

The model and serial numbers are shown on the nameplate of the unit. Record this information for future reference.

### **Principles of a Sliding-Vane Pump**

Corken's Coro-Vane® pumps are a special type of rotary positive displacement pump, known as a sliding vane pump.

The sliding-vane pump has many of the positive displacement advantages of the gear pump, plus the ability to compensate for wear, and operate at a lower noise level.

The sliding-vane pump consists of a rotor turning in a cam (liner) machined eccentrically in relation to the rotor; thereby displacing the liquid trapped between the rotor, cam and vanes. Coro-Vane® pumps are made with vanes produced from advanced polymers which exhibit extremely low coefficients of friction. The vanes self-adjust for wear and extends the pump life.

## Exclusive Features of the Coro-Vane® Pump

The pumping of volatile liquids is one of the most difficult of all pumping jobs, so more attention must be given to the design and manufacture of the pump and to its installation and operation.

In addition to being especially suited for handling volatile liquids, the Coro-Vane® pump has a number of features to help make it more easily operated and maintained.

Coro-Vane® pumps are manufactured in six models: the Models D51 and F51 small stationary and the Models 521, 1021, F1021 and F1521 stationary pumps. The Models F1021 and F1521 have ANSI flanged connections. All six models have been registered and listed by the UNDERWRITERS' LABORATORIES, INC. for use in the handling of LP-Gas and Ammonia.

The CASE AND HEADS are made of ductile iron for extra strength and toughness.

The VANES are manufactured of advanced polymers to provide excellent life and quiet operation. After long service, the vanes are simply and inexpensively replaced.

Both the CAM and the SIDEPLATES are easily replaced should the need arise.

The MECHANICAL SEAL is designed for longer life under greater loads and may be inspected or replaced without disturbing the piping of the pump. No special tools are needed.

BEARINGS are heavy-duty roller type for long bearing life.

PRESSURE GAUGE connections, 1/4" pipe thread, are provided.

The PUMP NOZZLES on Models 521 and 1021 are equipped with flanges to simplify piping. It is not necessary to provide unions in the piping system near the pump because the flanges serve this purpose.

The RELIEF VALVE is built-in as part of the pump on models 521 and 1021 and is adjustable under pressure.

NOTE: EVEN WITH THIS INTERNAL SAFETY VALVE, AN EXTERNAL BYPASS VALVE MUST BE INSTALLED.

#### **Chapter 1—Installation Procedures**

#### 1.1 Location

The installation of the Coro-Vane® pump is simple; however, in order for the pump to deliver optimum performance, the principles discussed in this book should be followed. The piping details in figure 1.2 illustrate methods proved by hundreds of installations. Your own needs may require slight variations, but every effort should be made to follow the recommendations identified in this manual.

No pump can discharge more liquid than it receives, so the pump location and the inlet piping must be given careful attention. If the inlet piping is unable to supply the demand of the pump, you may expect trouble. The inlet sizes shown in figure 1.2 are the smallest piping size you can use with success.

For the transfer of flammable liquids like LPG, the pump must be installed according to the applicable local safety and health regulations. The installer and/or the user must take into account the following:

- The pump must be located as near the storage tank as possible. The complete inlet line, including the vertical line from the tank must not exceed twelve feet (3.7 m) in length.
- The bottom of the tank must be no less than two feet (0.6 m) above the pump inlet nozzle, with four feet (1.2m) considered standard.
- The foundation for the pump is important. The foundation must be firm, level and preferably made of concrete. The suggestions in figure 1.1 should be observed.

Figure 1.1

- Potential risk due to local conditions regarding the installation and operation (e.g. poor ventilation and additional risks due to other elements in the vicinity, etc.).
- Qualification of the personnel.
- Type of liquid being transferred.
- Specific safety measures to be applied (e.g. gas detection, automatic shut-off valves, personal protective equipment, etc.).

The following table shows the weight of the bare pump for each model. For handling a bare pump, lifting slings should be used. Web slings are preferred over metal slings to minimize damage to the paint. See <u>Appendix D</u> for outline dimensions.

Model	Shipping Weight: Ib (kg)
D51	50 (22.7)
F51	25 (11.3)
521	132 (59.9)
1021	200 (90.7)
F1021	200 (90.7)
F1521	235 (106.6)

Figure 1.2: Typical Piping Diagram

## 1.2 The Inlet Piping Should Include the Following:

- 1. The tank excess flow valve (EFV) should have a flow rate of 1-1/2 to 2 times the capacity of he pump. Do not use an EFV without knowing its flow capacity.
- 2. The tank shut-off valve must be a free-flow type and not a standard globe valve.
- 3. A strainer of the "Y" type, with 30 to 40 mesh screen, must be on the inlet line of the pump. (Mesh size indicates the number of openings per lineal inch).
- 4. Use a flexible connection in the pump inlet and outlet piping to compensate for piping strains.
- 5. Use an eccentric swage at the pump inlet nozzle to change the line size (flat side up).
- 6. Make the inlet line level or slope it downward to the pump.
- 7. The minium inlet piping sizes shown in figure 1.2 must be observed.

## 1.3 The Outlet Piping Should Include the Following:

- 1. A pressure gauge should be installed in the pump outlet or near it. A pressure gauge is necessary to determine the efficiency of your pumping system.
- 2. A hydrostatic relief valve is required by most state laws and for your own safety.
- 3. If the outlet piping exceeds 50 feet (15.2 m) in length a check valve should be installed near the pump outlet.
- 4. The minimum outlet piping sizes shown in figure 1.2 should be observed.

## 1.4 The Bypass System Must Include the Following:

- A pump bypass system must be installed. If the pump discharge is shut off before the driver is stopped, dangerously high pressures can develop, unless a bypass valve is installed to permit the pump to discharge back to the supply tank, at a predetermined pressure.
- 2. The pump may have an internal relief valve, but it is intended as a safety relief valve device and not an operational bypass.
- Always install an external bypass relief valve (such as the Corken B177) in the pump discharge line. The bypass valve may discharge into the tank at any convenient opening, either liquid or vapor; however, it should not connect into the pump inlet piping system.

Model	Maximum Differential Pressure
521, 1021, F1021	125 psi (8.8 kg/cm²)
F1521	100 psi (7.0 kg/cm²)

## 1.5 A Vapor Equalizing System Should be Included:

To obtain maximum performance from the Coro-Vane® pump, a vapor equalizing system should be installed. This system is simply a pipe connecting the vapor sections of the tank being unloaded and the tank being filled. This equalizing line allows vapor to move freely between the two tanks (in either direction) and assures that both tanks remain at the same pressure.

As liquid is withdrawn from a tank, it must be replaced by an equal amount of vapor or the pressure in the tank will drop. If an equalizing line is not present, this vapor is formed by "boiling" of the liquid and a reduction of the tank's pressure. Meanwhile, the tank being filled experiences a pressure increase as the rising fluid levels compresses the vapor space above it. A vapor equalizing line will eliminate both of these problems and will reduce pumping time, differential pressure, noise and wear on the entire system. Slow transfer rates will minimize these effects and reduce the need for a vapor equalizing line. However, today's high transfer rates require the installation of a vapor equalization line.

Another way to consider this principle is to remember how it takes two holes in an oil can for oil to be poured smoothly from the can; one for the oil to exit and the other for the air to enter. The piping and hose sizes shown in figure 1.2 are minimum requirements.

#### 1.6 Driver Installation

Model	Maximum Speed
521, 1021, F1021	950 RPM
F1521	860 RPM

The wiring of your electric motor is extremely important and must be done by a competent electrical contractor. The following wire sizing chart indicates the minimum standards for wire sizes.

Motor		Recommended wire size, AWG <sup>1</sup>				
Нр	Motor	Volts	Approximate Full	Le	ngth of Run	(ft)
	Phase		Load Amperes	0–100	to 200	to 300
3	1	115	34.0	6	4	2
		220	17.0	12	8	8
	3	230	9.6	12	12	12
		460	4.8	12	12	12
5	1	115	56.0	4	1	1/0
		230	28.0	10	6	4
	3	230	15.2	12	12	10
		460	7.6	12	12	12
7-1/2	1	230	40.0	8	6	4
	3	230	22.0	10	10	8
		450	11.0	12	12	12
10	3	230	28.0	8	8	8
		460	14.0	12	12	12
15	3	230	42.0	6	6	6
		460	21.0	10	10	10
20	3	230	54.0	4	4	4
		460	27.0	8	8	8
25	3	230	68.0	2	2	2
		460	34.0	6	6	6
30	3	230	80.0	1	1	1
		460	40.0	6	6	6
40	3	230	100.0	2/0	2/0	2/0
		460	52.0	4	4	4
50	3	230	130.0	3/0	3/0	3/0
		460	65.0	2	2	2

<sup>&</sup>lt;sup>1</sup> Based upon 3% voltage loss copper wire type TW. Single phase motor calculations are based on two times distance.

Improper motor wiring will cause expensive motor difficulties from low voltage. If you suspect you have low voltage, call your power company. Connecting your motor for the voltage you have available is important too. The motors furnished with the stationary pumps are usually dual voltage, so you must be sure of the voltage your power company is supplying you. Your motor will be completely ruined if it is connected to the wrong voltage.

A humid climate can cause problems, particularly in explosion proof motor applications. The normal breathing of the motor, and alternating between being warm when running and cool when stopped, often will cause moist air to be drawn into the motor housing. This moist air will condense, and may eventually add enough free water to the inside of the motor to cause it to fail. To prevent this, make a practice of running the motor and pump at least once a week on a bright, dry day for an hour or so (pumping through the bypass system). In this period the motor will heat up and vaporize the condensed moisture, and drive it out of the motor. No motor manufacturer will guarantee an explosion proof or totally enclosed motor against damage from moisture.

Engine drivers pose a special consideration. The manufacturer's instructions must be followed. When the stationary pump is equipped with an engine from the factory, the engine speed should normally not exceed 1,800 RPM. Excessive engine speed will overload the engine and cause early failure. The engine loses 3% of

its power for every 1,000 feet (305 m) above sea level, so if your installation is at a higher altitude than normal, consult the factory.

### **Chapter 2—Operation Procedures**

Performance curves and charts are provided in Appendix C.

The following steps should be performed for the initial pumping operation:

- 1. Verify the strainer screen is clean.
- 2. Rotate the pump by hand.
- 3. Check V-belt drive or direct drive coupling alignment. Misalignment will cause accelerated wear of the drive system, motor bearings and pump.
- 4. Check motor for proper wiring.
- 5. Review complete system to make certain the function of every valve and piece of equipment is clearly understood. Everyone operating this system must be properly trained in normal operating procedures and emergency procedures in event of a malfunction.
- 6. Close all hose valves.
- 7. Slowly open the storage tank bottom shut-off valve (suction line to the pump). Immediately check the system for leaks.
- 8. Open any shut-off valves between the bypass valve and the storage tank.
- 9. Make a note of all pressure gauge readings, especially the pressure gauge located at the discharge of the pump. Start the pump and circulate the liquid through the bypass system back to the storage tank.
- 10. Verify the proper pump rotation direction. There is an arrow cast in the pump case.
- 11. An ammeter may be used by adjusting the bypass valve until the ammeter indicates the full load motor amperage rating shown on the motor nameplate or maximum rated differential, whichever comes first. Permit the pump to circulate liquid for half an hour or more. If the motor overload protection device stops the motor in this period the bypass valve setting is too high and should be readjusted until the motor will run for half an hour. After a satisfactory setting is achieved, "seal" the valve adjusting stem to prevent tampering with the adjustment. See IH102 for more details on the use of the Corken bypass valves.
- 12. If your pump has an internal relief valve, it must be set higher than the external bypass setting. The internal relief valve may be adjusted while the pump

is under pressure by removing the flush seal plug. Turning the adjusting screw clockwise will decreases the internal relief valve setting. Replace the flush seal plug after adjustment.

13. After initial operation, re-check the strainer screen.

## **Chapter 3—Maintenance Procedures**

ALL REPAIRS TO THE PUMP MUST BE PERFORMED BY QUALIFIED PERSONNEL IN A SAFE MANNER, UTILIZING TOOLS AND/OR EQUIPMENT THAT ARE FREE OF HAZARDS, AND FOLLOWS THE APPLICABLE SAFETY CODES OF PRACTICE SET BY THE LOCAL AUTHORITIES HAVING JURISDICTION. MAKE SURE THE SYSTEM PRESSURE HAS BEEN RELIEVED BEFORE ATTEMPTING ANY REPAIR TO THE PUMP.

A pump requires regular maintenance and care like all mechanical equipment. A neglected or improperly repaired pump will result in premature failure and cause unsafe conditions.

To promote product longevity and safety, maintenance must be performed by properly trained technicians. Make sure all safety systems are in place and the system pressure has been relieved before attempting ANY maintenance.

Make sure the transfer hoses are not "kinked" which can cause excessive pump discharge pressure. Always make sure your hoses are not out of date.

There are two lubrication points in which to grease the pump bearings; one zerk per bearing cap located at opposite ends of the pump. Four grease relief and seal ventilation fittings have been provided, two at each end of the pump, to prevent overgreasing the bearings. Overgreasing can cause seal failure if grease passageways are blocked in some way. Clean each fitting before lubricating the bearings. This practice helps to prevent foreign-material contamination of the bearings and accidental over-pressurization of the mechanical seals. Use only ball bearing grease (MIL-G-10924C) with a temperature rating of -50°F.

Normal wear parts are the mechanical shaft seals, bearings, vanes and sideplates. All of these parts plus O-rings and grease seals are offered in the Corken "repair kit" listed in this manual directly after the Seal Replacement Instruction on page 10. Use only genuine Corken replacement parts when repairing the pump.

When it becomes necessary to repair your pump or remove it from the system, you must be absolutely certain that all propane, anhydrous ammonia or whatever product being pumped is bled from the pump and connecting piping. Once all the product has safely been bled from the pump and connecting piping, make certain no pressure is left in the system.

SPECIAL CARE MUST BE TAKEN DURING THE BLEED DOWN PROCESS TO AVOID DANGER TO PERSONNEL AND PROPERTY IN THE AREA.

Bleeding a system too fast is a common mistake and may leave "refrigerated" liquid in the pump and piping even though the pressure gauge shows no pressure. As the "refrigerated" liquid begins to warm, more gas will escape causing a dangerous condition. Take your time in bleeding your system and make proper provisions to vent or capture the gas in accordance with local regulations. ONLY A PROPERLY TRAINED INDIVIDUAL SHOULD BE ALLOWED TO BLEED A PUMPING SYSTEM.

#### **Pump Maintenance Schedule**

	Daily	Monthly	Three
	Dany	IVIOTITITY	Months
Lubricate bearings			X <sup>1</sup>
Inspect drive coupling			Χ
Clean inlet strainer		Χ	
Check for leaks	Χ		
Inspect hose and fittings	Χ		

<sup>&</sup>lt;sup>1</sup> Continuous duty applications may require monthly lubrication.

Figure 3

If the pump's use is seasonal, then special care must be taken during the off season to protect your pump from corrosion. If it is feasible and safe to keep the pump pressurized with product during the off season, this will prevent the entrance of any moisture or air. This system should be checked periodically to make certain all of the gas has not bled out.

If the pump is to be removed from service for some time, the pump must be protected., as propane, butane and anhydrous ammonia all leave the metal "bare" and open to corrosion. Piping and tanks not in service should also be protected, as the rust that forms can destroy the pump's seals almost immediately after start-up. To prevent these problems, complete the following:

- Fill or thoroughly flush the pump with a light rust inhibiting oil. If the pump is flushed with oil, placing some desiccant packets inside the pump will provide added protection.
- 2. Plug all pump openings.
- 3. Store in a dry location.
- 4. Before placing the pump back into service, drain the oil and remove any desiccant packets.
- 5. Before operating the pump, refer to chapter 2 of this manual for operation procedures.

## 3.1 Preventative Maintenance Procedures

#### **Purpose**

By following an effective preventive maintenance program, unscheduled downtime can be eliminated. This program should be used by the Operation Manager to get a maximum utilization of manpower and equipment as well as to prevent possible unsafe situations and/or production delays due to equipment breakdown.

#### Scope

The maintenance chart in figure 3 includes the items to be regularly checked and inspected with a recommended time schedule. These are basic maintenance recommendations, and each company should develop their own comprehensive preventive maintenance program schedule, tailor-made to their individual operational procedures and requirements.

Maintenance must only be performed by a properly trained and qualified individual following all the applicable safety procedures.

#### **Procedures**

Every procedure herein recommended must be performed in a safe manner (utilizing tools and/or equipment which are free of hazards) and following the safety codes of practice set by the authorities having jurisdiction. These are general guidelines and are not intended to cover all the safety aspects that must be considered and followed while performing these procedures.

#### 1. Visual Inspection:

This includes checking for leaks, corroded areas, condition of hoses, piping and fittings, and any unsafe condition which may hinder the safety of the personnel and/or the facility.

#### 2. Clean Inlet Strainer Screen:

A clogged strainer screen will create too much flow restriction and vapor will be formed causing the pump to cavitate. This reduces the pump's capacity and accelerates the wear of the internal parts.

#### 3. Inspect Drive Coupling and Driveline:

Check the coupling alignment and the condition of the union for cuts, broken sections and wear.

#### 4. Lubricate Pump Bearings:

Use only ball bearing grease, applied with a manual lubrication pump or gun. Always clean the grease openings thoroughly before greasing.

#### 5. Lubricate Motor Bearing:

Follow the recommendations of the electric motor manufacturer for the type of grease to use and the lubrication frequency.

#### 6. Performance Test:

- a. While transferring liquid with the pump, check the pressure at the pump's inlet port. The pressure drop in the inlet piping should not be greater than 3 psi.
- b. While transferring liquid with the pump, close the discharge valve(s) so the full flow will be directed back to the storage tank through the bypass valve. Then slowly close the valve downstream of the bypass valves. The discharge pressure of the pump should increase to the maximum differential pressure of the pump at no flow conditions (see Appendix C—Performance Curves).
- c. If the maximum differential pressure is not obtained, the pump must be serviced. See <u>Appendix G</u>—Troubleshooting Guide for additional help.
- d. Replace vanes or sideplates if worn.
- 7. Tighten all hold-down bolts.
- 8. Inspect motor starter contact points. This procedure must be performed by an authorized and qualified electrician according to the electric motor manufacturer's guidelines.

## Chapter 4—Seal Replacement Instructions

For all models 521 and 1021.

Simple as A, B, C... but watch alignments A, B and C or your new seal will leak!

Caution: Bleed all pressure from the pump and piping before starting to install your seal assembly.

#### **Cleanliness**

Even the smallest amount of dirt on your new seal can cause early failure. Keep all parts, tools and your

hands clean while installing the seal. Never touch the smooth lapped faces of the carbon rotor or seal seat. With LP-Gas, anhydrous ammonia, and similar liquids, the fluid is 5 to 10 times thinner than water so the smooth/lapped surfaces of the new seal need to be as clean as possible.

#### Workmanship

This pump is a precision piece of equipment with very close clearances and should be treated with care. Never beat on it when inserting or removing parts.

## Step 1 Depressurize and open the pump. Remove the bearing cap and bearing housing. Should the bearing housing be rusted or frozen in place it may be necessary to remove the entire pump head. The housing can then be driven out gently with a block of wood. Remove the old shaft O-ring and discard it. Never reuse an old O-ring except in an emergency. If you are also installing a new bearing or grease seal do so now. Follow established safety Head regulations! Bearing housing Bearing cap Seat adapter plate Shaft O-ring Bearing Bearing retainer ring Grease seal

#### Step 2

#### Remove the old seal.

The seat adapter plate can be removed using a bearing cap bolt as a puller. Disregard the old adapter plate O-ring, seat, and seat O-ring. Remove and discard the rest of the old seal. Thoroughly clean all surfaces that contact O-rings. Use fine emery or crocus cloth. The shaft under the seal O-ring should be shiny smooth. Lubricate all surfaces with a clean, light oil. Do not let dirt settle on the parts.

Caution: Mechanical seals are precision devices. Care must be used when handling and installing the seal seat to prevent chipping or cracking.

Shaft drive pin

## Step 3 Proper alignment of the new seal.

This is the most critical step of the seal installation. With clean hands unwrap the new seal without touching the seal faces.

A. Locate the notch on the back of the retainer assembly and position over the shaft drive pin as shown in the illustration. If the shaft drive pin is not aligned with the notch, the seal will be

notch, the seal will be improperly positioned and leak. It should not require any force to install the retainer assembly.

Hold the carbon rotor without touching the lapped face; lubricate the rotor O-ring with a light oil and install both on the pump shaft. (For the optional PTFE Coro-Seal installation, see the following paragraph.)

If you are using the optional PTFE Coro-Seal, make sure the shaft is very clean and smooth as the PTFE seal is not as tolerant of surface blemishes as rubber O-rings. After lubricating the Coro-Seal, install in the backside of carbon rotor with the spring toward you and slide the carbon rotor in position as previously described.

B. The two grooves in the carbon rotor must line up with the drive indentations in the retainer assembly. If they do not, the seal will be improperly positioned and leak. Do not allow the carbon rotor to cock. This may chip the lapped face.

#### Step 4

#### Completing the installation.

After applying some oil to the new adapter plate O-ring, insert it into the pump head. Without touching the lapped face, insert the new seat and oiled seat O-ring into the adapter plate. Install the adapter plate in the pump head. Install the shaft O-ring on the shaft.

C. Slide the bearing housing over the shaft and install the bearing cap using a criss-cross method on the bolts and make sure the pump shaft turns freely.

Watch alignment C!

#### Step 5

#### Proper lubrication.

For proper lubrication, use MIL-G-10924C ball bearing grease only. Each pump is equipped with a grease zerk and relief fitting. Before greasing the bearing, the grease zerk and relief fitting must be cleaned thoroughly. If any dirt is forced through the grease zerk, early bearing failure will result.

Overgreasing will damage the pump bearings. To help prevent overgreasing, use a hand operated grease gun. Insert the grease slowly and stop as soon as the relief fitting opens. Excessive grease may drip out of the relief fitting for several hours after lubrication.

#### Do not overgrease!

NOTE: When lubricating truck pumps, grease the U-joints and the spline of the drive shaft as well.

#### Step 6

#### Repressurize the system.

For best results slowly pressurize the pump with vapor before introducing liquid to the pump. When liquid enters a unpressurized pump-even slowly-it can sometimes refrigerate enough to keep the O-rings/elastomers from sealing properly and cause a leak.

Vapor first, then liquid!

## 4.1 Repair Kits and Spare Parts for Sliding-Vane Pumps

#### D51 and F51 Standard Repair Parts (no kit available)

2296-1X_6ª	Seal assembly
2451-2	Vane
2-154_a	Case O-ring
2491	Sideplate

#### D51 and F51 Additional Spare Parts<sup>a</sup>

2492-X	Rotor and shaft assembly
2471	Roller bearing

#### 521 Repair Kit 2904-X26<sup>b</sup>

1163-2	Sideplate
1168-7	Vane
1358	Grease seal
1769-XRA6	Seal assembly (replacement)
2-112A	O-ring, Buna-N
2-224A	O-ring, Buna-N
2-227A	O-ring, Buna-N
2-234A	O-ring, Buna-N
2-261A	O-ring, Buna-N
2010	Flange gasket
2014	Grease seal, thrust
2754-X	Roller bearing

#### 521 Additional Spare Parts<sup>a</sup>

1166-1X1R	Rotor and shaft assembly
1162-2	Cam (liner)

#### 1021 and F1021 Repair Kit 2906-X26<sup>b</sup>

1209-1	Sideplate
1308-9	Vane
1358	Grease seal
1769-XRA6	Seal assembly (replacement)
2-112A	O-ring, Buna-N
2-228A	O-ring, Buna-N
2-245A	O-ring, Buna-N
2-249A	O-ring, Buna-N
2-268A	O-ring, Buna-N
2014	Grease seal, thrust
2754-X	Roller bearing

 $<sup>^</sup>a$  For a complete list of parts and O-rings, see parts details in <u>Appendix E</u>.  $^b$  All repair kits have Buna-N O-rings which are suitable for both LPG and  $\rm NH_3$  applications.

#### 1021 and F1021 Additional Spare Parts<sup>a</sup>

1208-1X1R	Rotor and shaft assembly
1201-2	Cam (liner)

## Appendix A—Model Number Identification Code

#### Models D51 and F51

#### **Product Description**

- D51 Bare pump with mounting bracket and flexible coupling to close couple the pump to any NEMA 56 or 66 C-face motor (Note motor is not included).
- F51 Frame mounted pump for baseplate mounting (bare pump only).

	Base Model #	D51	F51		Model Number		
	Inlet	1" NPT	1" NPT		Base X X X X		
	Outlet	3/4" NPT	3/4" NPT		IIIII		
	Weight bare pump lbs. (kg)	40 (18.1)	25 (11.3)				
Specification	Fields

#### **Mounting Options**

Part Number	Model Reference	Maximum Motor Frame Size	Ship Weight Ib (kg) Mounting Only	Mounting Option
103-9-	521	245T	422 (191)	Mounting set up for V-belt drive. Includes steel baseplate, adjustable motor slide base, V-belt drive, and enclosed
103-10-	1021 and F1021	284T	560 (254)	belt guard.
102-	All		Consult Factory	Mounting set up for use with engine driver through V-belt includes steel baseplate, flexible coupling and guard
101GRB-	All	254T	Consult Factory	Mounting set up for direct drive. Includes size B gear reducer, steel baseplate, reducer bracket, couplings, and coupling guard.
101GRC-	All	324T	Consult Factory	Mounting set up for direct drive. Includes size C gear reducer, steel baseplate, reducer bracket, couplings, and coupling guard.

<sup>&</sup>lt;sup>1</sup> Registered trademark of the DuPont company.

## Appendix B—Specifications for Models D51 and F51

### **Operating Specifications**

Minimum RPM:	1450
Maximum RPM:	1750
Minimum temperature:	-25°F (-32°C)
Maximum temperature:	225°F (107°C)
Maximum working pressure:	350 psig (25.2 bar g)
Maximum differential pressure:	125 psi (8.6 bar d)
Maximum driver size:	2 hp (1.5 kW)
Flow range:	1–6 gpm (4–23 L/min)

#### **Material Specifications**

Part	Model	Material
Case, head rotor	All	Ductile iron ASTM A536
Sideplate	All	Gray iron ASTM A48, Class 30
Seal seat	All	Silicon carbide
Seal rotor	All	Carbon
Seal metal parts	All	Steel
Vanes	All	Carbon
Relief valve springs	All	Steel, cadmium plated
Relief valve	All	Steel
Shaft	All	"Stressproof" steel
Mounting bracket	D51	Gray iron ASTM A48, Class 30
Base	F51	Steel
O-rings	All	Buna-N (standard), PTFE (optional), Viton®1 (optional), Neoprene®1 (optional)
Relief valve adjusting stem seal	All	Buna-N
Retainer rings	All	Steel
Bearings	All	Cylindrical roller

<sup>&</sup>lt;sup>1</sup> Registered trademark of the DuPont company.

## Appendix B—Specifications for Models 521, 1021, and F1021

#### **Operating Specifications**

Model	521	1021	F1021				
RPM range	420-950	420-950	420-950				
Temperature range		-25°F (-32°C) to 225°F (107°C)					
Maximum working pressure psig (bar g)	400 (28.6)	400 (28.6)	400 (28.6)				
Maximum differential pressure psid (bar d)	125 (8.6)	125 (8.6)	125 (8.6)				
Maximum driver size hp (kW)	10 (7.5)	20 (15)	20 (15)				
Flow range gpm	30–85	65–195	65–195				

#### **Flange Options**

Model		Standard	No Cost Option	Extra Cost Option
521	Inlet	2-1/2" NPT	2" NPT	2", 2-1/2" weld flange
321	Outlet	2" NPT	1-1/2", 1-1/1" NPT	1-1/2", 2", 2-1/2" weld flange
1001	Inlet	3" NPT	4" NPT	3", 4" weld flange
1021	Outlet	3" NPT	4" NPT	3", 4" weld flange
F1001	Inlet	3" 300# ANSI	_	_
F1021	Outlet	2-1/2" 300# ANSI	_	_

#### **Material Specifications**

Part	Model	Standard Material
Case, head, flange, rotor, seat adapter plate	All	Ductile iron ASTM A536, Class 30
Cam, sideplate, bearing cap	All	Gray iron ASTM A48, Class 30
Welding flange	All	Steel
Seal seat	All	Silicon carbide
Seal metal parts	All	Steel
Shaft	521, 1021	"Stressproof" steel
Vanes	All	Plastic
Relief valve spring	521, 1021	Steel, cadmium plated
Relief valve	521, 1021	Steel
Bearing	All	Cylinder roller
O-rings	All	Buna-N (standard), PTFE (optional), Viton®1 (optional), Neoprene®1 (optional)
Retainer rings	All	Steel

O.E.	2593-1	Coupling with spider	1
25.	2774	Coupling spider only	1

Ref No.	Part No.	Description	Qty.
26.	7002-025NC062A	Bolt socket head	9
27.	7001-037NC100A	Bolt hex head	4
28.	7012-006SF019E	Nameplate screw	2

- <sup>a</sup> \_ denotes material code. See material chart for details.
- <sup>b</sup> Registered trademark of the DuPont company.
- The pump relief valve is installed at the factory to operate as an external bypass through the 1/2" NPT hole back to the storage tank. To change from this external configuration to an internal relief valve, remove relief valve plug 2585 and relief valve springs 2586 and 2587. Then remove flush seal plug 2590 and plug the 1/2" NPT opening. Replace the relief valve plug and springs. In this case a separate external bypass valve must be used in the piping between the pump discharge and the storage tank. Set the internal valve at a pressure slightly above the setting on the external valve. Use only the outer relief valve spring 2587 for units with 1/3 hp motors. Use both springs for 1/2 hp motors and larger. Always replace the flush seal plug 2590 that screws into the relief valve plug 2585 after any relief valve adjustment.
- <sup>d</sup> Bearing replacement: Install roller bearing 2471 with open side of grease seals toward outside of pump as shown below.

## **Appendix E—Parts Details for Model F51 (Frame Mount)**

Ref No.	Part No.	Description	Qty.
1.	2592	Key-1/8" sq. x 9/16"	1
2.	3442	Pipe plug—1/4" NPT	1
3.	2468-1	Case	1

27.	7012-006SF019E	Nameplate screw	2

- <sup>a</sup> \_ denotes material code. See material chart for details.
- <sup>b</sup> Registered trademark of the DuPont company.
- The pump relief valve is installed at the factory to operate as an external bypass through the 1/2" NPT hole back to the storage tank. To change from this external configuration to an internal relief valve, remove relief valve plug 2585 and relief valve springs 2586 and 2587. Then remove flush seal plug 2590 and plug the 1/2" NPT opening. Replace the relief valve plug and springs. In this case a separate external bypass valve must be used in the piping between the pump discharge and the storage tank. Set the internal valve at a pressure slightly above the setting on the external valve. Use only the outer relief valve spring 2587 for units with 1/3 hp motors. Use both springs for 1/2 hp motors and larger. Always replace the flush seal plug 2590 that screws into the relief valve plug 2585 after any relief valve adjustment.
- <sup>d</sup> Bearing replacement: Install roller bearing 2471 with open side of grease seals toward outside of pump as shown below.

## Appendix E—Parts Details for Seal Assembly (1769 Series)

#### All Models 521 and 1021

Ref No.	Part No.	Description	Qty.
1.	1769-X_6ª	Complete seal assembly	1
2.	2760-244	Retainer ring	1
	2754-X	Roller bearing, complete	1
3.	2754	Bearing outer race	1
	2755	Bearing inner race	1
4.	1769	Bearing housing	1
5.	2-128_a	Shaft O-ring	1
6.	Not sold separately <sup>d</sup>	Seal seat	1
7.	2-227_a	Seat O-ring	1
8.	1822°	Seat adapter plate	1
9.	2-240_a	Adapter plate O-ring	1
10.	Not sold separately <sup>d</sup>	Carbon seal	1
11.	2-223_a	Rotor O-ring	1
12.	Not sold separately <sup>d</sup>	Disc	1
13.	Not sold separately <sup>d</sup>	Retainer assembly	1
14.	1769-XR_6°	Field replacement seal assembly	1

Material Code					
Α	Buna-N				
В	Neoprene®b				

- \_ denotes material code. See material code chart

Do not use a V-belt drive system on a Coro-Vane® pump with a driver greater than 25 horsepower. Consult factory if your application is outside this parameter.

## **Appendix G—Troubleshooting Guide**

In diagnosing pump and system troubles, record the following data during product transfers:

- 1. Pressure at pump suction.
- 2. Pressure at pump discharge.
- 3. Pressure in truck tank.
- 4. Pressure in tank being filled.

- 5. Pipe size and length of suction and discharge lines.
- 6. Size and length of vapor equalizing line.
- 7. Pump speed if practical.

Symptom	Probable Cause	Remedy
Low capacity	Pump speed too slow	Check engine speed and PTO ratio. Consult pump performance curve. Use tachometer on pump if speed is questionable.
	High differential pressure	Restriction in discharge piping or hose too small. Vapor equalization lines too small or not used.
	External bypass valve stuck open or set too low	Readjust, repair, or replace valve.
	Clogged strainer	Clean strainer.
	Suction pipe too small or restricted	Indicated by pump inlet pressure dropping several pounds when pump is started. Remove restriction or modify piping.
	Worn vanes	Replace.
	Pump without vapor return	Without vapor equalization, a pump can remove only about 3% of the truck tank capacity per minute without severe cavitation and capacity loss.
	Worn sideplates	Reverse or replace sideplates. Check universal drive assembly to make sure angularity is within limits, yokes are parallel and slip-joint is greased. Check bearings.
	Vanes sticking	Remove vanes and clean out foreign matter (check strainer). Replace vanes if swollen.
Pump runs but no flow	Valve closed	Check valves. Make sure internal tank excess flow valve is open! Refer to manufacturer's instructions.
	Excess flow valve slugged	Stop pump until valve opens. If problem continues, slow pump down or install a new or larger excess flow valve.
	Broken shaft	Disassemble and inspect pump. Repair if necessary.
	Defective meter	Service meter.
Pump will not turn	Foreign matter in pump	Clean out the pump and check strainer in suction line
or is locked up	Vanes broken	Clean out pump carefully and replace vanes. Has pump been operated dry? Then, check for damage to cam and rotor shaft assembly.
	Bearing seized	Replace pump bearings. Grease monthly. Use ball bearing grease manufactured for intended service.
	Moisture frozen in pump	Let thaw and break loose carefully. Add alcohol to tank (on LP-Gas). Check with product supplier about the possibility of water in the gas.
Will not build	Poor suction conditions	Clean inlet strainer. Increase pipe size.
pressure	External bypass valve set too low	Set valve for higher pressure—see instructions.
	Worn vanes and/or sideplates	Disassemble, inspect and repair as necessary. Do not run pump dry!
Pump is noisy	Cavitation from poor suction conditions	As above.
	Vanes sticking	As above.
	Bearings worn	Replace if necessary and grease monthly.
	Very high differential	Check for restriction in discharge line. Delivery hose too small pressure and too long. Slow down pump!
		Check vapor release float assembly on meter and meter differential valve.
	PTO shaft vibration	Inspect and repair driveline component.
Pump leaks around shaft	Seal or O-rings failed	Inspect seal assembly and replace if necessary. Keep new seal very clean when replacing seal. Recommend a light oil film on O-rings. Do not run pump dry!

## **Appendix H—Extended Storage Procedures**

If the pump is to be removed from service for some time, it must be protected as propane, butane, and anhydrous ammonia all leave the metal "bare" and open to corrosion. Piping and tanks not in service should also be protected, as the rust particles can destroy the pump's seals almost immediately after startup.

- 1. Fill or thoroughly flush the pump with a light rust inhibiting oil. (If the pump is flushed with oil, place some desiccant packets inside the pump for added protection.)
- 2. Plug all pump openings.
- 3. Store in a dry location.
- 4. Before placing the pump back into service, drain the oil and remove any desiccant packets.
- 5. Refer to the "Operation Procedures" on page 7 of this Installation, Operation and Maintenance (IOM) manual.
